“The Primary Objective

of the Return™ system is to properly deploy fixed equipment assets or turn them back into liquidity in the terms of cash...**Simple As That.**”

Effectively Redeploy Assets

Return™ is an online tool which allows companies to actively manage their capital equipment assets and MRO inventory. This system was designed to support enterprise organizations with three or more locations. It facilitates communication and provides a decision tree by which decisions can be made. The system encourages proper redeployment of assets, identifies assets as “Surplus” to the organization and seamlessly transitions these “Surplus” assets to an external marketplace for sale to the public.

Reduce Depreciation

The Return™ system works off of the following general valuation principles:

- An asset loses the least value by being effectively redeployed within an organization
- An idle asset costs a company money by using valuable floor space where an active asset could be placed which would earn revenue (Plant Square Footage/Gross Revenue)
- An idle asset incurs true depreciation even after it has 0 Net Book Value. This is due to factors such as physical deterioration, technological, functional, and economic obsolescence
- Assets are still subject to property taxes in many cases regardless of their “In Service” status

Improve Return On Assets

Return™ has built-in reporting features which allow for fully customizable data that is exportable into Microsoft® Excel®. Since this system is web-based, real-time reports can be generated 24 hours a day, 7 days a week from any computer with an Internet connection, regardless of location.

Return™ is based on a core system; however, customizable applications can be developed to meet each client's needs.

The core Return™ system has built in equipment sourcing capabilities, and a capital expenditure approval system. It also has an appraisal feature allowing for one-click appraisal requests which produces an appraisal report for any item in the system. These appraisal reports can be used to determine the asking price for an item, to provide documentation for international shipping, to make financial adjustments for Fair Value accounting, and many other uses.

The Return™ system is available with no upfront costs and possibly no costs all together based on your company's usage.

Maximize Your Return
